

Basic Diagram Video Messenger Lan/Internet Operation

PC running VMConsole

The Video Messenger can be remotely controlled over a LAN, WAN or the Internet using the the VMConsole software for the Windows® PC and the IP/Serial Port Converter. The Video Messenger, VM-3 can be configured in any of three ways, ie, as a stand alone electronic bulletin board, as a character generator displaying over broadcast TV & Satellite, or as a multi-media control unit with the DV Pro Media player. This last configuration allows the system to display still images and video with message overlay on a predetermined schedule.
